PRODUCT MANAGEMENT & UX DESIGN

Hey there, I’m Juliette

I'm a product manager in the making.

I use UX design thinking to create products that have 2 clear purposes: answer their users’ call for support, and help solve some of the biggest challenges we are facing today.

I care about the 3 big ‘Ts’: sustainability, accessibility and inclusivity.

My work process is anchored in simple concepts: honest communications, the ability to share knowledge in simple language, thoughtfulness between teammates, and doing serious work without taking oneself too seriously.

This portfolio walks through my process on real projects, starting with a training app I designed and built for myself and my partner.

Case Study 01

Ganbare : a simple and effective training app built for easy tracking and scheduling

ROLE	USERS	PLATFORM	STATUS
Product & UX, solo	Me & my partner	Web app	In daily use

My partner and I train for several sports and physical abilities in any given week. Up until now, we kept our plans scattered across a spreadsheet, a notes app, a timer, our calendars and pen + paper. The whole process felt messy, dispersed, and unsustainable.
We created Ganbare ("go for it" in Japanese) to centralise all five with one weekly view we actually open and use every day.

"We should build this"

We had our own and joint reasons to build an app together.

I wanted to:
- Apply and put in practice what I learned in the UX design and product management courses I took to upskill my career into product.
- Increase my hireability in today's product job market.
- Learn how to use product tools e.g. Figma for design, Claude AI, and VS Code

My partner was all about what he was going to learn, as well as the bonus that he actually wanted to use the product. He wanted to learn how to vibe-code, build a full app with htmx+Golang, and how to use figma.

Jointly, we are both on this big health journey of getting back into shape. We needed a tool that could:
- Help us to commit to our training goals with its design and features
- Make it as easy as possible to stick to new and healthy habits
- Bring consistency within our training
- Materialize abstract goals through quantifiable data

"We actually built it"

So here we are. Ganbare. Several needs, one deed.

We designed an app that supports our objectives of training and organising ourselves towards a healthier lifestyle. It brought structure and ease of organisation in our week. No more need to use several tools to track one thing.

Checked off on our list:
- Provided a UX that is effective in its simplicity. No fuss, no unnecessary features. Only what we need to manage our training.
- No more spreadsheet, timer, pen & paper, digital notes, calendar - just one app.
- Both of us started to use Figma for our work, learning the basics.
- I started using Claude AI and VS code within product work and beyond.
- I put into practice what I learned in the courses into my own actual product, from ideation to launch.

My partner's testimony on Ganbare:
"One of the big values the product brings for me is that it's easier for me to stay consistent with my exercise if I have my planned sessions written down somewhere, and have a weekly goal I'm trying to hit".

How we started

How it's going

The problem: 5 tools, 0 picture

Multiple sports, many environments, different muscle targets, busy schedules, no centralised view. We had reached for whatever tool fit each job — and lost the ability to see any of it together. It kept us afloat for a while, but we realised it was a temporary solution that couldn't support our long term goals.

We needed a tool to stay organised but more importantly, committed. We wanted to harness organisation to create discipline and yield commitment. A way to keep tabs on our progress and help us manage our week between training, recovery days and our favourite sport activities.
Once we committed to structured training across multiple sports, we needed to be able to plan sessions easily, create and log workouts, time intervals, record sets and reps, and see the week at a glance all in one place.
We combined our skills and knowledge to solve our problem and created Ganbare: the app to help us achieve our fitness goals, support our exercise habits and honour our long-term commitments for a healthy life.

Digital Calendar
The only weekly view we had — but with none of the workout detail in it.

iPhone Notes
The exercises themselves — sets, reps, cues — disconnected from the schedule. Messy to update, no clarity.

Excel Spreadsheet
Weekly plan & scheduling — manually rebuilt every week, with no connection to actual session notes or timing.

A separate timer
Duration-based intervals, tracked outside any record of the session.

Pen & paper
Quick notes jotted down mid-session, easily lost or forgotten, not formatted for archiving.

The thought process

01 **Empathize — Living the problem**
Spent 2 months using the initial tools across different types of training and sports to experience their necessity, limitations, and identify clear areas of improvement. Debriefed on each experience and built a product brief to guide us through innovating and improving our training process.

02 **Define — Scoping for two people, on purpose**
Identified our discipline goals and solutions to the obstacles we faced in organising our training. Determined what core actions we needed to perform on the app to meet our objectives. Explored personal edge cases and established the MVP features to guide our efforts in phase 3.

03 **Ideate — Sketch, flow, then build**
Sketched out wireframes to establish rough user flows by using Figma for creating / planning / logging a workout, and weekly view + organising. Refined into 5 pillars for the user to structure their training.

04 **Develop & Test — Ship it into our own week**
Launched an initial basic version to start testing theories and iterate on designs and flows. Identified gaps and areas for improvement, implemented updates and entered next testing phase. Every real training week was a usability test for us to identify friction.

The solution

Four screens replace four tools: a weekly plan, a session builder, an in-session tracker, and a library to host the training activities.

Weekly plan

Weekly plan
A single view of the week across every sport, replacing the spreadsheet.

Session builder

Session builder
Assemble a workout from exercises with a choice of metrics and notes in one place.

Session tracker

Session tracker
Built-in interval timer logs duration alongside the workout, live.

History

History
Past sessions and trends, so progress is visible without digging.

Product decisions & trade-offs

Built for two users, not two million
Intuitive actions for the users to jump in and start their training organisation right away. No need for an onboarding flow. No fancy or superfluous features that don't have a clear purpose. Ganbaru is meant to provide organisational solidity and easy-tracking.

Manual entry over automatic tracking
Chose against wearable integrations — logging by hand means we prioritise a mindful and deliberate approach towards our training.

One weekly view over a feature checklist
Cut a social feed, badges, and goal-setting wizards early so the core weekly view could be right first.

Ganbare's User Interface (UI)

The app's design was created with the help of good old' pen & paper sketching, iterating with Claude AI on VS code, Figma and its Figma Make option. We wanted users to arrive on the app and be led through each step intuitively by the UI.
A few challenges arose:
- How do we make this app visually interesting when we are focusing on the most basic and simple interactions in workout tracking?
- Can we somehow encourage commitment beyond sharing metrics recaps ?

In parallel, we also decided that my partner should take over the UI creation for the app. He is naturally visually creative and a gifted artist so the decision making process was very straightforward: he would go have fun creating designs and I would consult from a UX perspective, help us stay true to the vision we had for the app.
As a result, he came up with several designs until we landed on this one.
The mosaic background shows the user their big-picture training results: each block represents their dedication and the time they spent adding to their life quality. It's not just a singular occurrence in a week or year, it's part of what they feed to their overall effort. Each workout is visually accounted for and as they amass, they create a visual that represents the bigger picture. Not just metrics or trends that exist only in the moment or on a report.
My partner drew inspiration from Lego for this: each piece just looks like a lonely piece on its own but stacked up, it creates a whole world, a composition made possible by each individual piece added.

Reflection & ideas for future iterations

We both use Ganbaru daily.
It's a small product: we designed it that way so that it answers our essential needs without unnecessary flourish or superficial features.
As our physical abilities change and our pull to certain sports fluctuates, so do our training goals. We know we will need the app to evolve with us.
We went about the process our own way, using industry standards across the UX, product and software fields, cutting out what we didn't need.

We started with a first version that supports a solid structure and has room for growth. When looking at the next version of Ganbaru and scoping out what it needs to become, we will be looking at adding:

- Training block setting
- Energy barometer
- Analytics
- Custom goals setting
- Background mosaic options

Ganbaru took us through the same discipline and design thinking framework any real product does — and we continue to iterate on it with each training .

ABOUT

Background & experience

EXPERIENCE

date

Product Manager

Self-directed project work

Led end-to-end design and development of Ganbare, a training app built around a real user need. Managed scope, defined MVP features, ran iterative testing cycles using our own daily training as a continuous usability study.
